What is a heuristic ?

Heuristic *[heu.ris.tic]*

Noun.

A quick and approximate method for solving a problem. People often use a rule-of-thumb as a heuristic for making decisions quickly.

Research toolkit

What is a "heuristic review"?

A heuristic review is a systematic process for finding potential design optimisations.

Analysis Key

	Motivation	Social signals	Brain limits	Bias & Behavior	Content	Friction	Affect
Good	Makes a customer take action (ie. a good price or a unique feature.)	Social context inspires trust and encourages consensus or conformity.	Easy, intuitive and simple.	Takes advantage of decision-making shortcuts.	Effective content & communication.	Makes a customer journey or action smoother.	Does it have a positive impact on the users' feelings?
Bad	Lack of reasons for a customer to take action.	Social context causes doubt or concerns.	Forces the visitor to think or overwhelms their faculties.	Undermined by decision-making shortcuts.	Bad content & communication.	An obstacle or hurdle that might obstruct a customer.	Does it have a negative impact on the users' feelings?

Beyond LIFT and levers

LIFT framework

A visualisation describing how 6 contextual factors affect potential customers.

- ✓ Captures the relationship between factors
- ✗ Limited range of concepts
- ✗ Doesn't apply to different audiences or goals

Lever framework

A matrix of UX factors that can be used to categorise experiments.

- ✗ Doesn't capture relationships between factors
- ✓ Wide range of concepts
- ✗ Doesn't apply to different audiences or goals

Our heuristic review framework

We structure our heuristic reviews through a set of analytical lenses. These draw from UX design theory, psychology, and behavioural science.

Motivation

How is the visitor inspired to take action?

Factors:

- Pricing
- Effort
- Product Benefits

Social signals

Does the social context inspire trust/conformity?

Factors:

- Star ratings
- Endorsements
- Activity

Brain limits

Does the experience overwhelm users' brains?

Factors:

- Simple numbers
- Focused design
- Organisation

Biases

What mental shortcuts are triggered?

Factors:

- Availability
- Anchoring
- Representativeness

Content

Is all necessary information clear and concise?

Factors:

- Clear copy
- Consistency
- Simplicity

Friction

Is the journey easy or are there hurdles?

Factors:

- UX design
- Accessibility
- Commitment

Affect

How does it make the user feel?

Factors:

- Meaningfulness
- Look and feel
- Brand affinity

Our heuristic review framework

1 Motivation

- PRICE
- SCARCITY
- EFFORT
- URGENCY
- TANGIBILITY

Key question: How is the user inspired to (or deterred from) taking action?

Motivation covers everything involved in the user's costs vs benefits calculation. It is often split into two kinds: "intrinsic" and "extrinsic".

1 Motivation

- PRICE
- SCARCITY
- EFFORT
- URGENCY
- TANGIBILITY

Key question: How is the user inspired to (or deterred from) taking action?

Disguising effort

2 Social signals

AUTHORITY

SOCIAL PROOF

CONSENSUS

IDENTITY

Key question: What kind of social context is visible to a new user? How is previous user activity shown?

When someone is unsure how to act, they often base their behaviour on social context.

Group influence

Majority opinion establishes a reference point that changes individual perceptions.

Conformity

People often follow the majority deliberately. This behaviour varies between individuals, but most people will conform under pressure.

Identity

Once people define a self-image, they will go to great lengths to act consistently with that identity.

Why do I need home insurance?

It's there to protect your pocket from the cost of fixing damage or replacing things that are stolen, usually because of bad weather or break-ins. In other words, if high winds hurl tiles from your roof, you find your lounge knee-deep in water, or a burglar empties your home of jewellery and laptops.

Do you already have home insurance with us?

3 Brain limits

Key question: Does the experience overwhelm users' cognitive limits?

The "Instructional Design" specialist John Sweller popularised the idea of "Cognitive Load" in the early '90s. His work drew on 50 years of cognitive psychology research.

3 Brain limits

Key question: Does the experience overwhelm users' cognitive limits?

The 'split attention effect'

Split attention

Modified

John Sweller and Paul Chandler, "Cognitive Load Theory and the Format of Instruction", *Cognition and Instruction* 8 (1991), 293-332.

Spans and limits
Miller (1956)

Reduce the number of items a user must keep in their heads

Chunking
Miller (1956)

Use natural groups and patterns to organize items that must be recalled

Highlighting
Von Restorff (1933)

Isolate important elements to guide a user's attention

Split attention
Sweller (1991)

Display all the information required to solve a problem in one place

Serial position
Glanzer & Cunitz (1966)

Place the most important items at the start or end of a list or paragraph

Interference
Baddeley & Hitch (1974)

Never over-burden a single faculty with more than one task at a time

Extraneous info
Sweller (1991)

Use as few words or examples as possible to illustrate an idea.

Single focus
Kahneman (1973)

Remove distractions when a user must complete a difficult task

Schema building
Sweller (1991)

When educating users, focus on creating clear mental models

Word length
Baddeley (1975)

Use short, clearly distinct words in lists or instructions

Doubt management
Sweller (1991)

Silence user's self-doubt by giving positive signals for correct actions

Dual coding
Allan Paivio (1969)

Give key information in multiple forms (text and image)

4 Biases

ANCHORING

ASSOCIATION

FRAMING

FOCUS

Key question: What kinds of mental shortcuts are triggered by the experience?

Most human thought is informal and irrational, based on rules-of-thumb rather than logic. Because of this, choices and behaviours are biased in lots of ways.

Cognitive biases

A systematic statistical trend that reflects skewed decision making.

Mental shortcuts

People use mental shortcuts and rules-of-thumb) to make decisions faster.

Behavioural effects

Field studies and experiments reveal consistent (and seemingly unconscious) patterns in behaviour.

Availability

Tversky & Kahneman (1974)

Things that are easy to recall seem more common or likely

Representativeness

Tversky & Kahneman (1974)

Things that look "right" feel more likely and plausible

Reflection effect

Tversky & Kahneman (1979)

Preferences can be reversed by switching a negative frame

Distance discounting

Tversky & Kahneman (1979)

Emotional distance can reduce the "pain of paying"

Framing

Tversky & Kahneman (1979)

Adjusting reference points & context can shift perception

Mental accounting

Thaler (1990)

People use informal rules when managing money

Default effect

Samuelson (1988)

People often conform to a perceived convention

Isolation effect

Tversky & Kahneman (1979)

Comparing differences rather than options is misleading

Decoy effect

Puto (1992)

A decoy C option can reverse preferences for A or B

Maximisation fatigue

Schwartz (2002)

The search for a "best" option can create dissatisfaction

Option attachment

Carmon (2003)

People try to maintain even less-favored options

Endowment effect

Thaler (1991)

People overvalue things that they already own

Zeigarnik effect

Zeigarnik (1938)

People tend to remember incomplete tasks

Consistency

Cialdini (1984)

People like to stay consistent with previous acts or beliefs

Scarcity

Worchel (1975)

Limited supply increases perceived value and urgency

Halo Effect

Thorndike (1920)

People often generalize from a single characteristic

All your questions answered

What does a Digital subscription include?

Our heuristic review framework

We structure our heuristic reviews through a set of analytical lenses called “Dimensions”. These draw from UX design theory, psychology, and behavioural science.

Motivation

How is the visitor inspired to take action?

Factors:

- Pricing
- Effort
- Product Benefits

Social signals

Does the social context inspire trust/conformity?

Factors:

- Star ratings
- Endorsements
- Activity

Brain limits

Does the experience overwhelm users' brains?

Factors:

- Simple numbers
- Focused design
- Organisation

Biases

What mental shortcuts are triggered?

Factors:

- Availability
- Anchoring
- Representativeness

Content

Is all necessary information clear and concise?

Factors:

- Clear copy
- Consistency
- Simplicity

Friction

Is the journey easy or are there hurdles?

Factors:

- UX design
- Accessibility
- Commitment

Affect

How does it make the user feel?

Factors:

- Meaningfulness
- Look and feel
- Brand affinity

TONE OF VOICE

CLARITY

AMBIGUITY

REGISTER

RELEVANCE

Key question: Is all the necessary information clear, consistent and concise?

When detail is missing, inconsistent or incomplete, users are less likely to engage with an offer.

Providing clarity is difficult due to:

1. The way people make sense of text
2. Non-linear reading habits

RELEVANCE

Key question: Is all the necessary information clear, consistent and concise?

F-pattern

When given unstructured blocks of content, disengaged readers default to an 'F-shaped' fixation pattern.

- First words on the left border get more attention.
- Subheadings and bullet points are critical.

Saccades

The visual field is split into Foveal and Peripheral areas. When reading, these are knitted together with saccades.

- The first saccade in a series tends to be the longest.
- When text is more difficult, right to left saccades increase.

Error fixation

Readers focus on errors and aberrations more than overall structure and content.

- Any published material, especially UI content, must be error-free.
- Pattern-breaking should be used strategically.

Visual Cuing

Readers react to visual clues about how to direct their attention without realizing.

- Images of another person's gaze can persuade us to look in the same direction.
- Gaze cuing occurs even in peripheral vision.

CLARITY

AMBIGUITY

REGISTER

RELEVANCE

Key question: Is all the necessary information clear, consistent and concise?

Concreteness

Use visual metaphors or graphs to explain ideas. Stick to concrete nouns where possible.

Continuity

Avoid orphan ideas and widow sentences. Every idea should be placed in context.

Integration

Avoid the split-attention effect by combining related material (i.e. instructions and UI elements).

Patterning

Predictable sentence patterns and regular paragraphs improve scanning and reading speed.

Economy

Short, simple sentences and words, minimal text and no repetition.

Directness

Use active, direct sentences with few qualifications or clauses.

6 Friction

USABILITY

AFFORDANCE

VISUAL CONTRAST

ACCESSIBILITY

JOURNEY PLOTTING

Key question: Is the journey smooth and linear or difficult and full of obstacles?

Customer journeys that require advance commitment without offering guarantees have a lot of Friction. Similarly, accessibility failures, hidden steps or inconsistent UX are all design features that prevent a user from progressing within a user journey.

← Macro

Micro →

Customer level friction

The customer struggles to commit due to the way a product or service is packaged.

Example: The product has a long contract and no buy-out clause.

Journey level friction

The customer struggles to progress because the conversion process itself is poorly organized.

Example: Customers must pay before they can try the product

UX friction

The customer is blocked by poor UX design that makes the journey difficult to complete.

Example: A CTA button is hidden or help text is missing

Ergonomic friction

Physical accessibility issues prevent a user from completing their journey.

Example: Poor visual contrast or mobile usability issues

6 Friction

USABILITY

AFFORDANCE

VISUAL CONTRAST

ACCESSIBILITY

JOURNEY PLOTTING

Key question: Is the journey smooth and linear or difficult and full of obstacles?

Usability checklist

1. **Visible status:** The status of the process is easily visible, and I can see my next step.
2. **Naturalness:** The design maps onto the real world. It fits my mental model.
3. **Control and freedom:** The user is in complete control, giving them freedom to make mistakes. There are clear “undo” and “redo” options.
4. **System standards:** The design language is consistent and follows rules.
5. **Error prevention:** mistakes are prevented by messaging and confirmation steps.
6. **Error recovery:** users can recognize and reverse mis-steps easily.
7. **Zero memory:** I don't have to remember things from another part of the interface.
8. **Streets and shortcuts:** There are novice and expert paths. A coherent route can be substituted for a shortcut when I am more confident.
9. **Visual economy:** No unnecessary clutter or distractions are shown.
10. **Help:** There are escalating levels of support when it's needed.

VISUAL CONTRAST

ACCESSIBILITY

JOURNEY PLOTTING

Key question: Is the journey smooth and linear or difficult and full of obstacles?

Accessibility principles

Perceivable

- Text alternatives for images and multimedia
- Assistive technologies
- Distinguishable content

Operable

- Controllable from a keyboard
- Enough time
- Help users navigate

Understandable

- Simple and coherent text
- Content operates in a consistent way
- Help users avoid/correct mistakes

Robust

- Compatible with current and future user tools

W3C provides an 80-point quick reference checklist.

7. Affect

BRAND

VISUAL IDENTITY

CONSUMERISM

TRUST

LOYALTY

Key question: How does the experience make a user feel?

“Affect” describes an underlying mood or emotional state. Brands are often evaluated based on “brand affect” (how they make a customer feel). Creating the right emotional response is an important part of web design.

Visual identity is made up of lots of elements:

- Colour palette
- Typography
- Imagery
- layout

Important elements to consider:

- Brand guidelines
- Font
- Colour scheme
- Hero image
- Tone of voice

End bottom trawling

Bottom trawling is bulldozing our ocean floor, undermining small-scale fisheries, and deepening the climate crisis. Let's end this destructive practice, starting with an immediate ban on bottom trawling in Marine Protected Areas and inshore zones.

[Sign the petition](#)

AFFECT

Patagonia is a brand with a strong focus on affect. Activism is the second menu item.

End bottom trawling

Bottom trawling is bulldozing our ocean floor, undermining small-scale fisheries, and deepening the climate crisis. Let's end this destructive practice, starting with an immediate ban on bottom trawling in Marine Protected Areas and inshore zones.

[Sign the petition](#)

AFFECT

Scrolling down the page just beneath the hero and they have given up prime website real estate to an important cause.

How to use your observations

Getting the most from your review

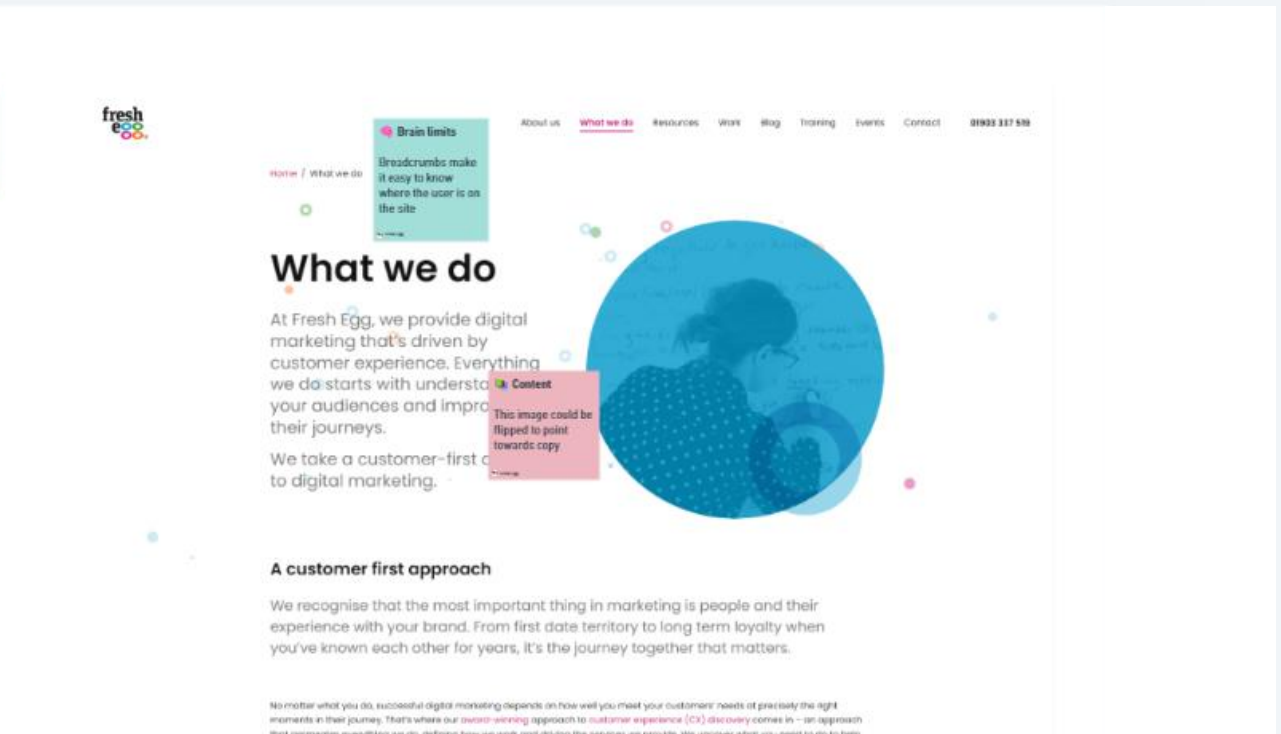

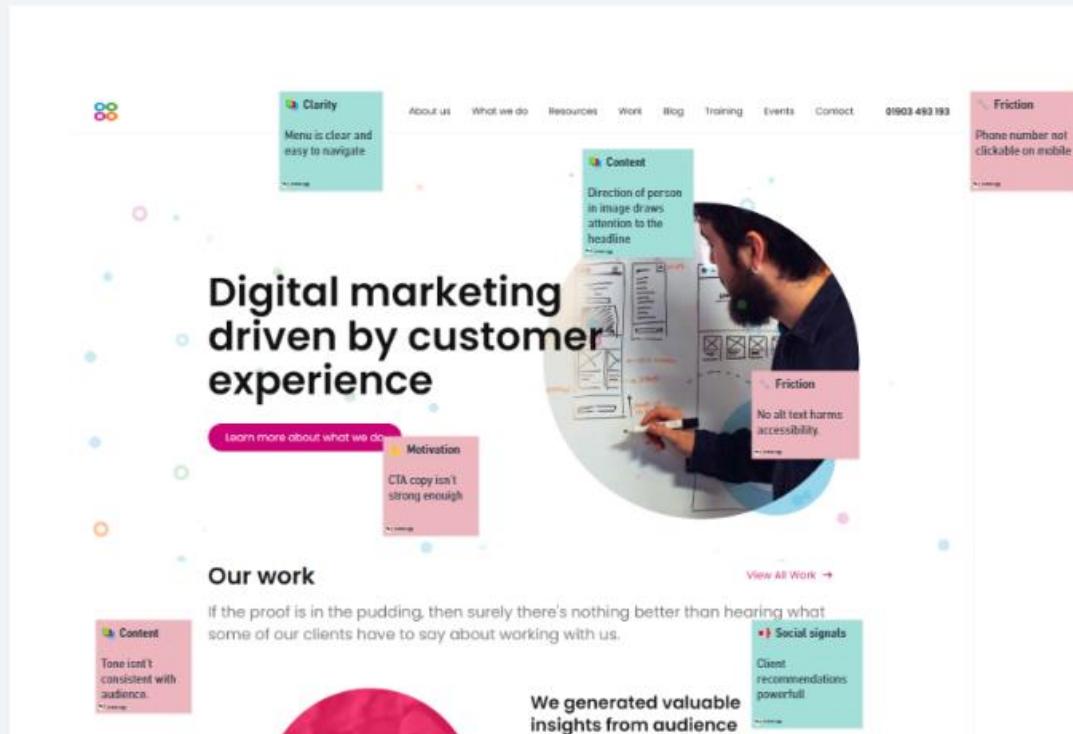

Progress

88%

Analysis Key

	Motivation	Social signals	Brain limits	Bias & Behaviour	Content	Friction	Affect
Good	Makes a customer take action (ie, a good price or a unique feature.)	Social context inspires trust and encourages consensus or conformity	Easy, intuitive and simple.	Takes advantage of decision-making shortcuts	Effective content & communication.	Makes a customer journey or action smoother	Does it have a positive impact on the users feelings?
Bad	Lack of reasons for a customer to take action	Social context causes doubt or concern	Forces the visitor to think or overwhelm their faculties.	Undermined by decision-making shortcuts	Bad content & communication.	An obstacle or hurdle that might obstruct a customer	Does it have a negative impact on the users feelings?

Identifying hypotheses

Once you have annotated your workspace, the observations and research insights can be translated into optimisation hypotheses.

Usually, hypotheses result from one of 4 situations:

1

Explaining analytics anomalies

Your observations help to explain a trend observed in the analytics data, such as a user journey step with a high exit rate.

2

Consistent themes throughout a journey

You have annotated the user journey with a single observation in numerous places.

3

Local cluster of observations

You have annotated specific area within the user journey with a number of different observations.

4

Direct impact on conversion rate

The issue you have identified is likely to cost conversions.

Using your hypotheses

A/B testing backlog

- ✓ Enough traffic on the page to generate results
- ✓ Reasonable degree of uncertainty
- ✓ Not possible to validate otherwise

Fresh Egg prioritisation matrix

Implementation backlog

- ✓ Reasonable degree of certainty
- ✓ Low risk
- ✓ A/B test not possible or not necessary

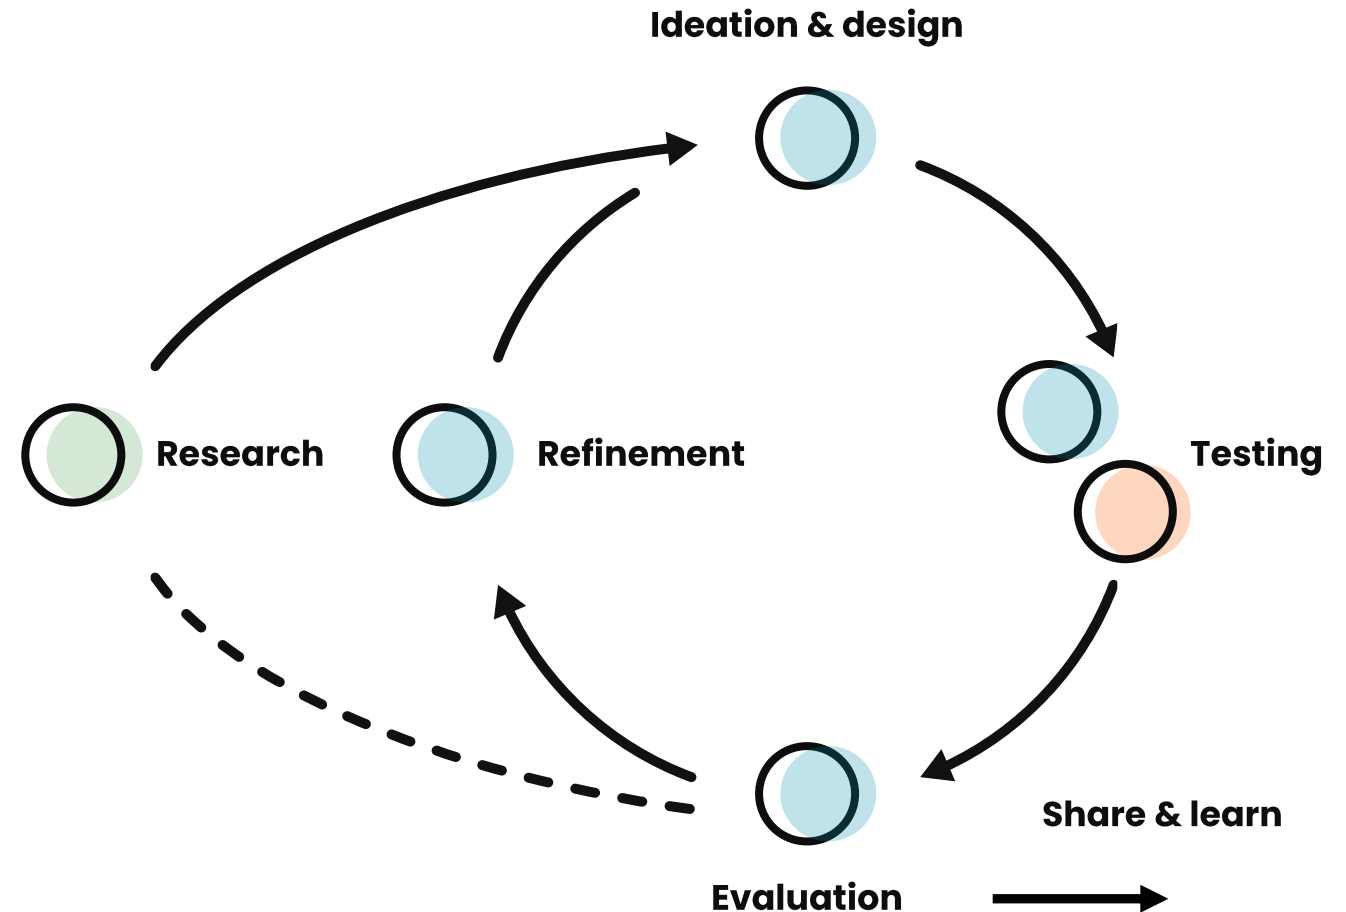

PIE prioritisation

Using your hypotheses

Next steps

- Prioritise your A/B test concepts and add the most exciting ones to a roadmap
- Prioritise your implementation backlog and create tickets for your developers
- Retain your workboard for solutionising workshops

Use cases for a heuristic review
